

Design and Development Services

At The Product Workshop we have the facilities and experience to take your idea into full production. The process to production is as follows.

Consultation

We offer a free initial consultation to discuss your idea, a design brief will then be draughted highlighting the key points to work towards.

Concept

From the design brief 2D and 3D concepts can be generated to form the beginnings of your product, at this stage we use CAD software to convey this information.

Prototype

When the design has been refined a 3D model can be created. Utilizing this method you can gauge how successful a product will be in the marketplace prior to tooling. We do this by creating a highly accurate, realistic model in a short period of time.

Tooling and Manufacture

The final stage of the development process takes the product to tooling, here we can project manage the product all the way to first off samples and mass production.
